

MARKETING BLUEPRINT / PRODUCT CAPABILITY NARRATIVE

Control every deliverable. Cite every decision.

A buyer-focused blueprint for positioning, demonstrating and launching EngiCite as the engineering document control and intelligence workspace for complex projects.

THE PRODUCT IN ONE SENTENCE

EngiCite helps EPC, EPCIC and owner teams plan the MDR, coordinate discipline submissions, control every revision, issue client transmittals and retrieve project knowledge with verifiable evidence.

Prepared for

EngiCite leadership, commercial partners, pilot customers and sales representatives

Version 1.0 | 13 August 2026 | Internal working document

EXECUTIVE BLUEPRINT

A controlled operating system for engineering information

EngiCite is not simply cloud storage. It connects the project plan, the MDR, discipline ownership, revision evidence, DCC acceptance, progress reporting and formal issue into one traceable workflow.

1

CONTROLLED SOURCE OF TRUTH

5

ROLE-SPECIFIC WORKSPACES

100%

EVIDENCE-BACKED AI TARGET

7 years

AUDIT-RETENTION DESIGN TARGET

The commercial story

- **Plan with confidence.** Turn an approved deliverables list or Excel MDR into a live, discipline-organised register with due dates.
- **Control submission quality.** Engineers upload only against assigned discipline deliverables; DCC previews and accepts before controlled issue.
- **See slippage early.** Progress, overdue work, discipline performance, weekly look-ahead and variance are visible before they become client problems.
- **Issue professionally.** Freeze accepted revisions into work packages and client transmittals with a controlled acknowledgement trail.
- **Find the proof.** Search and AI workflows return project evidence with document, revision and page-level provenance.

Blueprint reading guide: interface pages show the current development build; status pages distinguish demonstrated, configuration-dependent and release-readiness capabilities.

MARKET NEED AND POSITIONING

Engineering delivery is still fragmented across spreadsheets, folders and email

The cost is not just time spent searching. It is weak ownership, late submissions, uncontrolled revisions, incomplete handover records and management decisions made without reliable evidence.

Market pain	What teams experience	EngiCite response
MDR administration	Manual entry, inconsistent naming and slow updates	Excel import plus a structured, discipline-grouped register
Discipline coordination	Engineers submit through email or the wrong folder	Assigned discipline workspaces and controlled upload routes
Revision confidence	Teams cannot easily confirm the latest accepted file	Immutable revision history, preview and DCC acceptance
Schedule visibility	Missed dates become visible only during meetings	Due dates, overdue alerts, progress and weekly look-ahead
Client issue	Transmittals are assembled manually with weak traceability	Frozen issue sets, transmittal numbers and acknowledgement covers
Knowledge retrieval	Users search filenames rather than engineering evidence	Full-text, semantic retrieval and citation-grounded answers

CATEGORY POSITION

EngiCite is the engineering document control and intelligence platform for project teams that need disciplined delivery and defensible evidence - without forcing every user to become a document-control expert.

IDEAL CUSTOMER PROFILE AND BUYERS

Start where document complexity and delivery risk are both high

The strongest early market is project-based engineering work where multiple disciplines produce controlled deliverables against contractual dates.

Priority segment	Buying trigger	Primary value
EPC / EPCIC contractors	New FEED, DED, brownfield or construction project	Faster mobilisation, fewer late deliverables, controlled client issue
Owner-operators	Multiple contractors and inconsistent handover records	Oversight, auditability and a durable project knowledge base
Engineering consultancies	Growing project portfolio managed through Excel and shared drives	Standardised workflows without heavyweight enterprise rollout
Document-control service firms	Need to manage several clients with clear separation	Multi-tenant controls and repeatable DCC operations

The buying committee

- Economic buyer - Project Director / Operations Director: cares about risk, schedule, client confidence and predictable project reporting.
- Champion - Lead Document Controller: cares about MDR speed, revision accuracy, submission quality and formal transmission.
- Technical approver - IT / Information Security: cares about tenant isolation, access controls, auditability, retention and recovery.
- Daily user - Discipline Engineer: cares about a clear personal queue, due dates, simple upload and rapid feedback.

ROLE-SPECIFIC OPERATING MODEL

Each person sees the work they are accountable for

EngiCite separates management oversight, document-control authority and engineering submission responsibility so that one login does not expose every control to every user.

Role	Primary workspace	Core responsibility
Organisation administrator	Portfolio and organisation oversight	Create organisations and projects, maintain account structure, observe project health
Project administrator / manager	Project overview, health, resources and reports	Set project brief and objectives, invite the DCC and project resources, manage schedule
Document controller	DCC control centre, MDR, reviews and transmissions	Populate the MDR, assign disciplines, accept submissions and issue controlled records
Discipline engineer	My deliverables	See assigned documents and dates, upload revisions only for authorised disciplines
Viewer / stakeholder	Authorised project documents	Read, search, preview, compare and download according to policy

WORKFLOW IN ONE LINE

ADMIN SETS THE PROJECT > DCC BUILDS THE MDR > ENGINEERS SUBMIT > DCC ACCEPTS > MANAGEMENT TRACKS > CLIENT RECEIVES A CONTROLLED ISSUE

This operating model is a central differentiator: it makes the software feel simple to each user while preserving strong controls underneath.

PUBLIC PRODUCT EXPERIENCE

A precise promise before the buyer signs in

The landing page positions EngiCite around controlled delivery and evidence, with a direct path to the secure workspace and a visual demonstration of citation-backed answers.

Figure 1. Public landing page and product promise. Live development interface captured 13 August 2026.

- **Buyer clarity.** The headline communicates the two outcomes immediately: deliverable control and defensible decisions.
- **Product proof.** The interface mock demonstrates cited answers, register health and controlled documents without requiring a live login.

MULTI-TENANT WORKSPACE

Secure organisation separation

Users enter only the organisations and projects assigned to them. This creates a clean commercial story for contractors, owner teams and service companies managing multiple clients.

Figure 2. Authorised organisation workspace. Live development interface captured 13 August 2026.

- **Tenant awareness.** Organisation boundaries are explicit in the interface, not hidden inside a shared folder tree.
- **Simple navigation.** A user starts from authorised work instead of searching across the whole platform.

DOCUMENT CONTROLLER EXPERIENCE

A DCC control centre built around daily priorities

The home view gives the document controller a project-specific operating picture: total MDR deliverables, items awaiting review, unsubmitted work, overdue submissions and discipline resources.

Figure 3. Document Control Centre with project-level operating metrics. Live development interface captured 13 August 2026.

- **Action before administration.** Invite an engineer, transmit documents or open the MDR from the first screen.
- **Exception-led work.** The DCC sees overdue and unsubmitted work instead of manually reconciling spreadsheets.

MASTER DOCUMENT REGISTER

The MDR becomes a live project control surface

Documents are organised by discipline and can be filtered, searched, registered individually or imported from Excel. The register communicates ownership, type, due date and status in one view.

Figure 4. Discipline-grouped Master Document Register. Live development interface captured 13 August 2026.

- **Fast mobilisation.** Import an existing MDR rather than recreating hundreds of deliverables manually.
- **Flexible organisation.** Switch between a flat register, discipline groups and discipline-specific filters.
- **Governed creation.** Document registration remains a DCC-controlled responsibility.

TEAM AND DISCIPLINE GOVERNANCE

Invite engineers by discipline, not by individual document

The team workspace supports project invitations, pending invitation visibility, resend or deletion controls and discipline assignments that prevent engineers from uploading against another discipline's deliverables.

Figure 5. Project team and discipline resource controls. Live development interface captured 13 August 2026.

- **Scalable assignment.** One discipline invitation can govern a portfolio of planned deliverables.
- **Clear onboarding.** Pending invitations remain visible until accepted and can be resent or cancelled.

REVISION RECORD

Every logical document keeps its full history

Each MDR entry links to a document-specific record containing metadata, revision history, issue status, file state and secure preview actions.

Figure 6. Document detail and revision history. Live development interface captured 13 August 2026.

- One record, many revisions. Teams avoid duplicate document entries while preserving immutable revision evidence.
- Secure access. Preview and download are mediated through authorised routes rather than permanent public links.

SUBMISSION QUALITY GATE

DCC previews before accepting a revision

Engineer submissions enter a controlled review queue. The document controller verifies document identity, revision, issue status and file conformity before accepting the revision into the controlled record or returning it with instructions.

Figure 7. DCC submission review queue. Live development interface captured 13 August 2026.

- **Quality gate.** An uploaded file is not automatically treated as a controlled project issue.
- **Visible workload.** The navigation count shows how many submissions require DCC action.

ACTIONABLE NOTIFICATION CENTRE

Messages explain what happened and where

Notifications bring together submission, deadline, invitation and review activity. Messages can be opened in place, marked read and cleared without forcing the user into an unrelated page.

Figure 8. In-app notification centre. Live development interface captured 13 August 2026.

- **Operational context.** Submission messages identify discipline, document and revision rather than only stating that a revision exists.
- **Reduced noise.** Unread counts fall as messages are read and users can clear resolved items.

DELIVERY OVERSIGHT

Progress is calculated against the MDR

The project dashboard compares planned deliverables with uploaded, approved/final and overdue records, then breaks performance down by discipline.

Figure 9. Project and discipline delivery progress. Live development interface captured 13 August 2026.

- **Plan-based measurement.** The denominator is the complete active MDR, not an informal count of files in storage.
- **Discipline accountability.** Process, piping, structural and electrical performance can be reviewed independently.

MANAGEMENT REPORTING

A repeatable weekly progress report

EngiCite produces a client-ready project report using project identity, organisation and client logos, reporting period, overall progress, discipline performance, weekly plan, issued deliverables, variance, look-ahead, challenges and an S-curve.

Figure 10. Generated weekly project progress report. Live development interface captured 13 August 2026.

- Consistent presentation. Project data is transformed into a repeatable report instead of rebuilt in PowerPoint or Excel each week.
- Client-facing logic. Only DCC-accepted records count as issued; internal accept/reject activity is not exposed as client progress.

CONTROLLED HANDOVER

Freeze the exact issue set

The work package workspace lets authorised users assemble accepted revisions by discipline and issue status, then deliver a secure local package or a configured external destination.

The screenshot shows the 'Document control centre' interface. On the left is a dark sidebar with navigation links: Organisations, My project assignments, DCC control centre, Master document register, Submission review, Discipline engineers, Delivery progress, Work packages (highlighted), and Notifications. Below the sidebar is a 'ROLE SEPARATION' note. The main content area is titled 'Transmittals & engineering work packages' with a subtitle 'Issue selected documents to a client or freeze authorised revisions into a final project package.' and a 'New client transmittal' button. A message states 'No transmittals or work packages created yet.' To the right, there's a section 'Need to transmit selected documents?' with a 'Create transmittal' button. Below that is a 'Create frozen package' form with fields for PACKAGE NUMBER (FWP-001), PACKAGE NAME (Final engineering work package), PURPOSE, DISCIPLINE SCOPE (All disciplines), and REQUIRED ISSUE STATUS (Any accepted issue status).

Figure 11. Engineering work package and delivery workspace. Live development interface captured 13 August 2026.

- **Reproducible package.** The selected revision set is frozen so the delivered record cannot silently change later.
- **Flexible use.** The same controls support interim issue sets, final work packs and formal handover.

CLIENT TRANSMISSION

Create a professional transmittal from accepted revisions

The transmittal form captures a unique transmission number, recipient, purpose and cover message, then adds only current DCC-accepted revisions to the issue set.

Figure 12. New client transmittal form. Live development interface captured 13 August 2026.

- **Controlled selection.** Previously issued documents can show the transmittal number, reducing accidental reissue.
- **Acknowledgement-ready.** The package includes a client-facing transmittal cover suitable for receipt acknowledgement.

EVIDENCE RETRIEVAL

Search engineering content, not just filenames

Evidence search combines document metadata and extracted content so authorised users can locate the right record and navigate back to its source revision.

Figure 13. Engineering evidence search. Live development interface captured 13 August 2026.

- **Faster discovery.** Users can search by engineering concepts as well as document numbers and titles.
- **Scoped results.** Retrieval stays inside the active organisation and project permission boundary.

ASK ENGICITE

Project questions must point back to proof

The AI workspace is designed to answer only from selected, authorised project documents and cite the document number, revision and page. When the evidence is insufficient, the expected response is to say so.

Figure 14. Citation-grounded AI document question answering. Live development interface captured 13 August 2026.

- **Evidence first.** The differentiator is not a generic chatbot; it is a traceable answer linked to controlled source material.
- **Commercial note.** Live AI answers require configured OpenAI API billing and production data-control settings.

REPORT GOVERNANCE

A controlled history of weekly reports

Reports are stored as a project record, visible by reporting period, overall completion and overdue count. Role permissions determine who can generate or only read the report.

Figure 15. Weekly project report register. Live development interface captured 13 August 2026.

- **Auditability.** Management can revisit what was reported for a specific week rather than relying on overwritten files.
- **Role separation.** Project administrators control schedules and generation while other authorised users receive read-only access.

CAPABILITY STATUS

Market what is demonstrated - label what still needs configuration

The current build supports a compelling pilot demonstration. External-service and enterprise-readiness claims should remain clearly qualified until the listed controls are configured and evidenced.

Status	Capability	Marketing guidance
DEMONSTRATED	Secure sign-in; organisations and projects; role workspaces	Show in every pilot demo
DEMONSTRATED	MDR, discipline grouping, Excel import and submission dates	Lead with DCC time savings
DEMONSTRATED	Revision upload, history, secure preview and DCC review	Demonstrate the quality gate
DEMONSTRATED	Notifications, delivery progress and weekly reports	Use to sell management visibility
DEMONSTRATED	Work packages and client transmittal workflow	Show controlled issue and handover
CONFIGURE	AI answers and embeddings	Requires API credit, processor configuration and production data controls
CONFIGURE	Outbound invitation and overdue reminder email	Requires verified sending domain and Resend configuration
CONFIGURE	SharePoint / Google Drive delivery and qualified e-signature	Sell only after connector and signing-provider acceptance tests
RELEASE GATE	Malware scan, pen test, restore exercise, load test and production monitoring	Do not claim enterprise readiness before evidence is complete

Recommended public phrasing: 'built for secure, role-based engineering document control' until independent security and operational acceptance evidence is available.

TRUST STORY AND DIFFERENTIATION

Sell the control model, not only the feature list

The strongest competitive position is the combination of disciplined project delivery and evidence-backed intelligence in a product that remains understandable to engineers, DCCs and managers.

Trust pillar	Buyer-facing message	Proof required
Tenant isolation	Each organisation and project is separated by policy and server-side authorisation	Automated two-tenant RLS and IDOR test evidence
Least privilege	Each role sees only the controls needed for its responsibility	Role matrix, permission tests and denied-action audit events
Secure file access	Files use short-lived authorised access rather than permanent public links	Signed URL tests, private bucket policies and audit events
Traceability	Uploads, downloads, edits, reviews, transmissions and questions create an audit trail	Append-only audit verification and export review
Responsible AI	Customer documents are used only to answer authorised project questions, not for model training	Provider agreement, storage-off configuration and data-flow review
Resilience	Project records can be recovered and exported	Restore exercise, backup evidence and tenant export/deletion runbook

Competitive distinctions

- **Versus shared drives:** EngiCite knows the document number, discipline, planned date, revision, acceptance state and transmission history.
- **Versus generic DMS platforms:** the interface follows engineering delivery language and DCC operating practice from the first screen.
- **Versus standalone AI search:** answers sit on top of a controlled register and are expected to cite the accepted project source.
- **Versus spreadsheet MDRs:** the register becomes an active workflow with responsibility, reminders, progress and controlled issue.

MESSAGING ARCHITECTURE

One brand promise, three buyer conversations

MASTER PROMISE

CONTROL EVERY DELIVERABLE. CITE EVERY DECISION.

Audience	Lead message	Proof point
Project leadership	See delivery risk before it becomes a client escalation	MDR-based progress, overdue work, weekly variance and look-ahead
Document control	Run the register, reviews and transmissions from one controlled workspace	Excel import, discipline assignments, review queue and frozen issue sets
Engineering teams	Know exactly what is due and submit it without document-control guesswork	My Deliverables, authorised discipline scope, revision upload and feedback
Information security	Keep project records separated, authorised and auditable	Tenant policies, signed access, audit events and server-side secrets
Knowledge users	Find the answer and open the proof	Hybrid retrieval and document/revision/page citations

Approved short-form copy

- Homepage one-liner: Engineering document control, project delivery visibility and evidence-backed answers in one secure workspace.
- 30-second pitch: EngiCite turns the MDR into a live delivery system. DCCs organise and control the register, engineers submit against assigned disciplines, managers see progress and risk, and every issued record remains traceable.
- Demo close: From the first planned deliverable to the final client transmittal, EngiCite keeps the responsibility, revision and evidence connected.

COMMERCIAL DEMONSTRATION

A 12-minute demo that follows one deliverable

Avoid touring every menu. Tell one end-to-end story that makes the role separation and traceability obvious.

Time	Show	Commercial point
0:00-1:00	Landing page and organisation workspace	Clear category promise and tenant separation
1:00-3:00	Import or open the MDR grouped by discipline	Fast mobilisation and a controlled plan
3:00-4:30	Invite a discipline engineer and show assigned work	Ownership without exposing unrelated controls
4:30-6:00	Open document history and secure preview	Immutable revision evidence and authorised access
6:00-7:30	DCC review and acceptance	Quality gate before a document becomes controlled
7:30-9:00	Progress dashboard and weekly report	Early warning and repeatable management reporting
9:00-10:30	Create a transmittal or work package	Controlled issue set and professional client handover
10:30-12:00	Evidence search and Ask EngiCite	Open the proof behind a project answer

RECOMMENDED PILOT CLOSE

LET US LOAD ONE REAL PROJECT MDR, ASSIGN TWO DISCIPLINES AND RUN ONE DOCUMENT FROM PLANNED DATE TO CLIENT TRANSMITTAL.

90-DAY GO-TO-MARKET PLAN

Lead with a controlled pilot, then convert proof into repeatable demand

The first objective is not broad awareness. It is credible product proof with a small number of high-fit engineering organisations and document-control champions.

Phase	Commercial objective	Actions	Exit signal
Days 1-30 - Prepare	Make the product safe and demo-ready	Complete deployment, email/AI configuration, demo dataset, security evidence pack, pilot agreement and demo script	A repeatable 12-minute demo and a signed pilot checklist
Days 31-60 - Prove	Run 2-3 design-partner pilots	Import real MDRs, onboard DCC and engineers, measure setup time, overdue visibility and transmittal effort	At least one complete deliverable workflow and quantified customer outcome
Days 61-90 - Convert	Turn outcomes into demand	Publish a controlled case study, webinar, DCC guide, comparison page and partner outreach campaign	Qualified pipeline, reference customer and paid conversion proposal

Priority channels

- **Founder-led outreach:** project directors, lead document controllers and engineering managers in existing professional networks.
- **Design-partner workshops:** 60-minute MDR health assessment using the customer's current spreadsheet and workflow.
- **LinkedIn authority content:** practical DCC topics - late deliverables, revision errors, transmittal control and handover readiness.
- **Implementation partners:** document-control consultants, EPC digitalisation specialists and engineering project-service firms.

CAMPAIGN, FUNNEL AND PACKAGING

Convert operational pain into a measurable pilot

Funnel stage	Buyer question	Content / offer	Success metric
Awareness	Why do our MDR and transmittals still consume so much time?	Document Control Maturity Checklist; short workflow videos	Relevant engagement and checklist downloads
Consideration	Can EngiCite fit our project and roles?	Role-based product tour; MDR import demonstration; security overview	Qualified discovery meetings
Evaluation	Will it work with our real records?	One-project controlled pilot with agreed success criteria	Pilot activation and weekly active users
Conversion	Can we deploy safely and justify cost?	Outcome report, implementation plan, security evidence and commercial proposal	Paid project or annual subscription
Expansion	Can we standardise across projects?	Portfolio dashboard, reusable templates and champion enablement	Additional projects, seats and storage

Packaging hypothesis - validate through pilots

Package	Designed for	Commercial boundary
Pilot	One project team proving the workflow	Limited term, project, seats and storage; guided onboarding; AI optional
Project	A consultancy or contractor running active projects	Multiple roles, MDR, revisions, reporting, transmittals and defined usage limits
Enterprise	Owner-operators and multi-project organisations	Portfolio controls, SSO/SCIM, private connectivity/region options, advanced retention and integrations

Do not publish fixed prices until at least three pilot discovery cycles establish seat counts, storage, implementation effort and willingness to pay. Price the controlled project outcome, not the number of documents.

MEASUREMENT AND NEXT DECISIONS

Prove adoption, control quality and commercial value

A successful launch should show that teams complete controlled work faster and with fewer avoidable errors - not merely that users signed in.

Measure	Pilot definition	Why it matters
Time to first controlled project	Days from agreement to MDR imported, roles assigned and first revision accepted	Tests onboarding friction and implementation cost
DCC cycle time	Submission to accepted/returned decision	Measures operational responsiveness
On-time submission rate	Due deliverables submitted by planned date	Connects EngiCite to project performance
Revision rework rate	Submissions returned for metadata/file nonconformance	Measures quality improvement
Transmittal preparation time	Minutes from selection to completed issue package	Quantifies direct DCC time saving
Evidence retrieval time	Time to find the correct revision/page for a question	Quantifies search and AI value
Pilot-to-paid conversion	Pilots converting to a project or annual plan	Tests commercial fit

IMMEDIATE NEXT DECISION

SELECT ONE REPRESENTATIVE PROJECT AND DEFINE A PILOT SCORECARD BEFORE ADDING MORE FEATURE SCOPE.

- 1. Prepare a clean demonstration organisation with approved fictitious project, client and document data.
- 2. Complete production email, AI, processing, monitoring, backup and security evidence gates.
- 3. Recruit two DCC-led design partners and agree measurable before/after outcomes.
- 4. Record the 12-minute demo and produce a one-page pilot offer from this blueprint.

Know the answer. Cite the proof.

EngiCite connects the engineering delivery plan, controlled document record and project evidence into one secure workflow.

CONTROL EVERY DELIVERABLE | CITE EVERY DECISION

Internal blueprint. Replace demonstration project and customer data with approved marketing data before public distribution.
